☑ Class 12 Mathematics – Chapter: Probability

1. Introduction

- Probability is the branch of mathematics that deals with the likelihood of the occurrence of events.
- Extends basic concepts to **conditional probability**, **independent events**, **Bayes' Theorem**, and random variables.

2. Important Terms

- **Experiment**: An operation that gives some outcome.
- Sample Space (S): Set of all possible outcomes.
- **Event**: A subset of the sample space.
- Equally Likely Events: Events with the same probability of occurring.
- Mutually Exclusive Events: Events that cannot happen at the same time.
- Exhaustive Events: Events that cover the entire sample space.

3. Conditional Probability

Definition:

 $P(A \otimes B) = P(A \otimes B)P(B)P(B) = \frac{P(A \setminus B)}{P(B)}P(A \otimes B) = P(B)P(A \otimes B), \text{ provided } P(B) > 0P(B) > 0P(B) = \frac{P(A \otimes B)}{P(B)}P(B \otimes B)P(B)P(B \otimes B)$

Describes the probability of event A given that event B has occurred.

4. Independent and Dependent Events

- Independent Events: $P(A \boxtimes B) = P(A) \boxtimes P(B) P(X \subset B) = P(A) \setminus C \cup P(B) P(A \boxtimes B) = P(A) \subseteq P(A) \cup P(B)$
- If A and B are independent, then the occurrence of one does not affect the other.

5. Multiplication Theorem

For any two events A and B: $P(A \boxtimes B) = P(A) \boxtimes P(B \boxtimes A) = P(B) \boxtimes P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \setminus P(B \boxtimes A) = P(B) \setminus P(A \boxtimes B) = P(A) \cap P(A) = P(A) =$

6. Total Probability Theorem

If B1,B2,...,BnB_1, B_2, \dots, B_nB1,B2,...,Bn are mutually exclusive and exhaustive: $P(A)=\Sigma i=1$ nP(Bi)\\(P(A\\\ Bi)P(A\\\\ Sim_{i=1}^{n} P(B_i) \cdot P(A|B_i)P(A)=\(E_i=1nP(Bi)\\(P(A\\\ Bi)P(A)\)

7. Bayes' Theorem

Used to find the probability of an underlying cause given an outcome:

 $P(Bi \boxtimes A) = P(Bi) \boxtimes P(A \boxtimes Bi) \sum P(Bj) \boxtimes P(A \boxtimes Bj) P(B = i \backslash Frac\{P(B_i) \backslash P(A \boxtimes B_i)\} \{ \backslash P(A \boxtimes B_i) \} P(Bi \boxtimes A) = \sum P(Bj) \boxtimes P(A \boxtimes B_i) P(A \boxtimes B_i) P(A \boxtimes B_i) P(Bi \boxtimes A) = \sum P(Bj) \boxtimes P(A \boxtimes B_i) P(A \boxtimes B_i) P(A \boxtimes B_i) P(A \boxtimes B_i) P(B \boxtimes A) = \sum P(Bj) \boxtimes P(A \boxtimes B_i) P(A \boxtimes$

8. Random Variables

- A random variable assigns numerical values to outcomes of a random experiment.
- Probability distribution lists values of the variable and their probabilities.

9. Expected Value (Mean)

- $E(X)=\sum x\mathbb{N}\ P(x)E(X)= \sum x\mathbb{N}P(x), \text{ where } X \text{ is a random variable.}$
- Represents the average outcome.

10. Bernoulli Trials and Binomial Distribution

Bernoulli Trial: An experiment with exactly two outcomes (Success/Failure).

Binomial Distribution Formula: $P(X=k)=(nk)pk(1-p)n-kP(X=k)=\{n \land p^k (1-p)^{n-k}P(X=k)=(kn)pk(1-p)n-k\}$

11. Tips for Exams

- Know all formulas and when to use them.
- Draw probability trees and Venn diagrams for visual understanding.
- Practice plenty of conditional and Bayes' Theorem problems.

12. Real-Life Applications

Genetics, weather prediction, quality control, insurance, and risk assessment.
